**Description**

[0001] The present invention provides 3,7-dithiaprostanic acid derivatives, processes for the preparation of them and pharmaceutical compositions containing them.

5

**Background**

[0002] Prostaglandin E<sub>2</sub> (abbreviated as PGE<sub>2</sub> hereafter) has been known as a metabolite in the arachidonate cascade. Its known activities include cyto-protective activity, uterine contractile activity, a pain-inducing effect, a promoting effect on digestive peristalsis, an awakening effect, a suppressive effect on gastric acid secretion, hypotensive activity and diuretic activity etc. In recent study, it was found that PGE<sub>2</sub> receptor was divided into some subtypes which possess different physiological role from each other. At present, four receptor subtypes are known and they are called EP1, EP2, EP3 and EP4 (Negishi M. et al, J. Lipid Mediators Cell Signalling 12, 379-391 (1995)).

10

[0003] The present inventors investigated to find compounds which bind to each receptor specifically; we found that the compounds of the present invention could bind strongly to EP4 subtype receptor and then achieved the present invention.

15

[0004] The compound of formula (I) possess a binding activity for EP4 subtype receptor strongly. Therefore they are useful for the treatment and/or prevention of immunologic diseases (autoimmune diseases, immunological deficiency diseases, organ transplantation etc.), asthma, abnormal bone formation, neuronal cell death, liver damage, nephritis, hypertension, myocardial ischemia etc.

20

[0005] Among the compounds of the present invention of the formula (I), compounds which bind weakly to receptor subtypes except for EP4 receptors do not express other effects and therefore it is thought that such compounds will be a medical agent which have less side-effects.

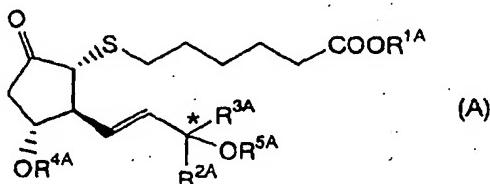

25

[0006] On the other hand, many modified PGs wherein 7th position carbon atom is replaced by sulfur atom are known. The following application is mentioned for an example.

#### Starting Materials and Reagents

5

[0034] Starting materials and reagents are known per se or may be prepared by known methods.

#### Properties of the Compound of the Invention

10 [0035] The compounds of the present invention of the formula (I) bind and act on EP4 receptor which is a subtype of PGE<sub>2</sub> receptor.

[0036] In a standard laboratory test, the activities of the compounds of the present invention were confirmed by binding assay using expression cell of the prostanoid receptor subtype.

15

(I) Binding assay using expression cell of the prostanoid receptor subtype

[0037] The preparation of membrane fraction was carried out according to the method of Sugimoto et al (J. Biol. Chem. 267, 6463-6466 (1992)) using the prostanoid receptor subtypes (mouse EP3α, EP4) expressing CHO cells.

20

[0038] The standard assay mixture containing membrane fraction (0.5 mg/ml) and <sup>3</sup>H-PGE<sub>2</sub> in a final volume of 200 μl was incubated for 1 hour at room temperature. The reaction was terminated by the addition of 3 ml of ice-cold buffer. The mixture was rapidly filtered through a GF/B glass filter. The radioactivity associated with the filter was measured by liquid scintillation counting.

[0039] Kd and Bmax value were determined from Scatchard plots (Ann. N. Y. Sci., 51, 660 (1949)). Non-specific binding was calculated as the bound in the presence of an excess (2.5 μM) of unlabeled PGE<sub>2</sub>.

25

[0040] In the experiment for competition of specific <sup>3</sup>H-PGE<sub>2</sub> binding by the compounds of the present invention, 2.5nM of <sup>3</sup>H-PGE<sub>2</sub> and various concentration of the compounds of the present invention were added. The following buffer was used in all reactions. Buffer: 10 mM potassium phosphate (pH 6.0), 1 mM EDTA, 10 mM MgCl<sub>2</sub>, 0.1 M NaCl. The dissociation constant (Ki) of each compound was calculated by the following equation.

30

$$Ki = IC_{50} / (1 + [C] / Kd)$$

[0041] Results are shown in Table 17 and 18.

[0064] 4R-t-butyldimethylsilyloxy-2-cyclopentenone (2.76 g) in methanol (40 ml) was cooled with ice. An aq. solution of hydroperoxide (31%, 5 ml) and a 1N aq. solution of sodium hydroxide (0.05 ml) were added to the solution. The mixture was stirred for 1.5 hrs at the same temperature. Saturated aq. solution of ammonium chloride was added to the reaction mixture and the mixture was extracted. The organic layer was washed, dried and evaporated. The residue was dissolved in chloroform (35 ml). A solution of 6-mercaptop-3-thiahexanoic acid methyl ester (2.34 g) in chloroform (10 ml) and active alumina (13 g) were added to the solution. The mixture was stirred overnight at room temperature. The reaction mixture was filtered. The filtrate was evaporated and purified by column chromatography on silica gel (hexane-ethyl acetate) to give the title compound (3.21 g) having the following physical data.
